SHOCK LOGIC — belly C-strip supply vs the P strip
The 5-10y sector (11/15/31 - 05/15/36, 10 coupon strips, \$25mm face) carries \$12,915/bp of DV01.
If that sector cheapens 5bp, the mark-to-market is -\$64,575.
The \$100mm principal strip carries \$62,080/bp, so a richening of just 1.04bp in the P strip offsets the entire 5bp move across the belly ladder.
This asymmetry is the economics of the stripping trade: with the P strip holding 42% of the package's total DV01 (\$146,717/bp), long-end zero demand (pension/LDI bid richening the P) funds the concession needed to clear the resulting C-strip supply in the belly.
